Harry Dillamore Portfolio Website

Initial Plan and Objectives

I wanted to create a clean, concise website to display my portfolio using HTML, CSS and Javascript. I wanted the site to look professionally made in order to demonstrate web development skills. I planned to host the site using github pages, and utilise Github actions in order to create auto documentation of the website's script using Doxygen. I plan for the site to be easy to update with different work as I develop my skills and experience.

Execution and Development

I started by creating a simple website layout that I was happy with, including a brief personal introduction and links to various points of contact (Github, LinkedIn, Itch.io, email). I created the initial code in `index.html` with the use of generative AI (Google Gemini flash 3.8). This helped with rapid development and implementation of the ideas I had. I then added some minimal animations to the site - one was a fade in effect which starts the content with `opacity: 0` and `transform: translateY(18px)` then JavaScript uses a `IntersectionObserver` to wait until the content is 12% on screen and fades in the card. I also added an effect which fades in extra information on each section on the wings of the central card. After the site was complete, I added the Doxygen automatic documentation.

Challenges and Adaptations

I had no previous experience with either GitHub actions or Doxygen, so I had to start by gaining a general understanding of them. I found that GitHub actions is used to run commands each time code is pushed to the repository, and that Doxygen is a compilation tool which looks for comment blocks and turns them into HTML documentation pages. Because of my unfamiliarity, I also did not understand that Doxygen was a tool mainly geared towards pure coding file types like C++ or C. To begin with the Doxyfile did not include .JS file types as a target until I added it to the `FILE_PATTERNS`.

The Github Actions build failed because it was looking for a `portfolio.js` file, within a `src` folder. But I had kept all my code within the root folder I resolved the issue by looking at the error provided by GitHub Actions and refactoring the structure to ensure that the files were all in the expected locations for the CI/CD pipeline to run.

Critical Reflection and Lessons Learned

I produced a website and portfolio that I am pleased with and I think effectively shows off some of my completed work and my web development ability, as well as being something that I can add to and tweak in the future. The development was more reliant on AI than I would have liked in order to speed up the process, but I am happy with my understanding of the code and ability to make the changes that I want to it. I also learnt skills completely new to me with the use of Doxygen and GitHub Actions, and would like to research more into what I could use these systems for in future projects. Such as for automated builds of games or uploading new builds of games to Steam or Itch.

AI Declaration

Gen AI (Google Gemini) was used for code creation and editing of supporting documents excluding Devlog.md
